

The "Problem Statement" Script (Approx. 40-45 Seconds)

Opening & Context

"To understand our proposal, we must look at the current 'As-Is' struggles at UTHM. Currently, UTHM operations are hindered by fragmented systems and manual dependencies, which we've categorized into two primary areas."

Point 1: Manual & Paper-Based Processes (PKU)

"First, looking at **Pusat Kesihatan Universiti (PKU)**, UTHM still relies heavily on manual documentation. This causes slow patient registration and makes tracking long-term medical histories difficult. This manual problem is a clear indicator that the current architecture is not yet fully digitized."

Point 2: Analytics & BI Issues

"Secondly, while UTHM has massive amounts of data, we are **information-poor**. Meaning that the data is trapped in separate systems. There is no real-time view or dashboard for university management. Decision-making is based on outdated data rather than real-time data because UTHM lacks a centralized Business Intelligence tool."

The Transition

"These gaps in healthcare efficiency and data visibility are exactly what our 'To-Be' architecture aims to solve. I'll now pass it to my other teammates to show you the proposed improvements."
